Principle of the Assay||This ELISA kit uses Competitive-ELISA as the method. The microtiter plate provided in this kit has been pre-coated with an antibody specific to PNOC. During the reaction, PNOC in the sample or standard competes with a fixed amount of biotin-labeled PNOC for sites on a pre-coated Monoclonal antibody specific to PNOC. Excess conjugate and unbound sample or standard are washed from the plate, and HRP-Streptavidin (SABC) is added to each microplate well and incubated. Then a TMB substrate solution is added to each well. The enzyme-substrate reaction is terminated by the addition of a sulphuric acid solution and the color change is measured spectrophotometrically at a wavelength of 450 nm. The concentration of PNOC in the samples is then determined by comparing the OD. of the samples to the standard curve.
