Principle of the Assay: hGH ELISA is based on solid phase sandwich hGH method. The samples and conjugate reagent (anti-hGH biotin & HRP) are added to the wells coated with Streptavidin. hGH in the patients serum binds to the matched pair Abs, forming a sandwich complex and simultaneously the complex is being immobilized on the plate through streptavidin-biotin interactions. Unbound protein and HRP conjugate are washed off, through a washing step. Upon addition of the substrate, the intensity of color is proportional to the concentration of hGH in the samples. A standard curve is prepared by relating the color intensity to the concentration of hGH.

Intended Uses: hGH ELISA kit is used for the quantitative measurement of hGH in human serum or plasma.
