ADDITIONAL INFORMATION

Related Product Information for OVA slgG elisa kit	Principle of the Assay: OVA-slgG ELISA kit applies the competitive enzyme immunoassay technique utilizing an anti-OVA-slgG antibody and an OVA-slgG-HRP conjugate. The assay sample and buffer are incubated together with OVA-slgG-HRP conjugate in pre-coated plate for one hour. After the incubation period, the wells are decanted and washed five times. The wells are then incubated with a substrate for HRP enzyme. The product of the enzyme-substrate reaction forms a blue colored complex. Finally, a stop solution is added to stop the reaction, which will then turn the solution yellow. The intensity of color is measured spectrophotometrically at 450nm in a microplate reader. The intensity of the color is inversely proportional to the OVA-slgG concentration since OVA-slgG from samples and OVA-slgG-HRP conjugate compete for the anti-OVA-slgG antibody binding site. Since the number of sites is limited, as more sites are occupied by OVA-slgG from the sample, fewer sites are left to bind OVA-slgG-HRP conjugate. A standard curve is plotted relating the intensity of the color (O.D.) to the concentration of standards. The OVA-slgG concentration in each sample is interpolated from this standard curve. Intended Uses: This OVA-slgG ELISA kit is a 1.5 hour solid-phase ELISA designed for the quantitative determination of Porcine OVA-slgG. This ELISA kit for research use only, not for therapeutic or diagnostic applications!
