ADDITIONAL INFORMATION

Related Product Information for anti-NPM1 antibody

This gene encodes a phosphoprotein which moves between the nucleus and the cytoplasm. The gene product is thought to be involved in several processes including regulation of the ARF/p53 pathway. A number of genes are fusion partners have been characterized, in particular the anaplastic lymphoma kinase gene on chromosome 2. Mutations in this gene are associated with acute myeloid leukemia. More than a dozen pseudogenes of this gene have been identified. Alternative splicing results in multiple transcript variants. NPM1 (Nucleophosmin) is a Protein Coding gene. Diseases associated with NPM1 include Leukemia, Acute Myeloid and Lymphomatoid Papulosis. Among its related pathways are Validated targets of C-MYC transcriptional activation and Chromosome Maintenance. GO annotations related to this gene include nucleic acid binding and protein homodimerization activity. An important paralog of this gene is NPM2.
