ADDITIONAL INFORMATION

Related Product Information for anti-GABRD antibody	This is a rabbit polyclonal antibody against GABRD. It was validated on Western Blot using a cell lysate as a positive control. Target Description: Gamma-aminobutyric acid (GABA) is the major inhibitory neurotransmitter in the mammalian brain where it acts at GABA-A receptors, which are ligand-gated chloride channels. Chloride conductance of these channels can be modulated by agents such as benzodiazepines that bind to the GABA-A receptor. The GABA-A receptor is generally pentameric and there are five types of subunits: alpha, beta, gamma, delta, and rho. This gene encodes the delta subunit.
