ADDITIONAL INFORMATION

Related Product Information for Coll elisa kit	Principle of the Assay: This ELISA kit applies the indirect technique. The microtiter plate has been pre-coated with Chicken COLL Ab antibody (solid phase antigen), standards or samples are added to the microtiter plate wells, then add Mouse secondary HRP labeled antibody. Wells are thoroughly washed to remove all unbound components. And a sandwich complex of solid antigen-antibody enzyme-labeled secondary antibodies is formed on the solid surface of the microplate. Next, Substrate solution A and substrate solution B are added to each well, and it will produce blue materials under HRP catalysis. The enzyme-substrate reaction is terminated by the addition of sulphuric acid and the color change to yellow. Measured spectrophotometrically at a wavelength of 450 nm, the absorbance (OD value) is positively correlated with the concentration of Mouse COLL AB in the sample. The concentration of COLL AB in the samples could be determined by comparing the O.D. of the samples to the standard curve. Intended Uses: This kit is used for detecting the Mouse COLL AB concentration of serum, plasma, and cell culture supernatant.
