Principle of the Assay: This ELISA kit applies the indirect technique. The microtiter plate has been pre-coated with OVA (solid phase antigen), standards or samples are added to the microtiter plate wells, then add anti-Mouse IgG2A HRP labeled antibody. Wells are thoroughly washed to remove all unbound components. And a sandwich complex of solid antigen-antibody enzymelabeled secondary antibodies is formed on the solid surface of the microplate. Next, Substrate solution A and substrate solution B are added to each well, and it will produce blue materials under HRP catalysis. The enzyme-substrate reaction is terminated by the addition of sulphuric acid and the color change to yellow. Measured spectrophotometrically at a wavelength of 450 nm, the absorbance (OD value) is positively correlated with the concentration of Mouse OVA IGG2A in the sample. The concentration of OVA IGG2A in the samples could be determined by comparing the O.D. of the samples to the standard curve.

Intended Uses: This kit is used for detecting the Mouse OVA IgG2a concentration of serum, plasma, and cell culture supernatant.

For Research Use Only. Not for use in diagnostic or therapeutic procedures. Small volumes of product may become entrapped in the seal of the vial during shipment and storage; if necessary, briefly centrifuge the vial on a tabletop centrifuge to dislodge any liquid in the cap.
