Intended Uses: This MAN1A1 ELISA kit is a 1.5 hour solid-phase ELISA designed for the quantitative determination of Mouse MAN1A1. This ELISA kit for research use only!

Principle of the Assay: MAN1A1 ELISA kit applies the competitive enzyme immunoassay technique utilizing a polyclonal anti-MAN1A1 antibody and an MAN1A1-HRP conjugate. The assay sample and buffer are incubated together with MAN1A1-HRP conjugate in pre-coated plate for one hour. After the incubation period, the wells are decanted and washed five times. The wells are then incubated with a substrate for HRP enzyme. The product of the enzyme-substrate reaction forms a blue colored complex. Finally, a stop solution is added to stop the reaction, which will then turn the solution yellow. The intensity of color is measured spectrophotometrically at 450nm in a microplate reader. The intensity of the color is inversely proportional to the MAN1A1 concentration since MAN1A1 from samples and MAN1A1-HRP conjugate compete for the anti-MAN1A1 antibody binding site. Since the number of sites is limited, as more sites are occupied by MAN1A1 from the sample, fewer sites are left to bind MAN1A1-HRP conjugate. A standard curve is plotted relating the intensity of the color (O.D.) to the concentration of standards. The MAN1A1 concentration in each sample is interpolated from this standard curve.
