Principle of the assay: HSP90 Alpha ELISA kit applies the competitive enzyme immunoassay technique utilizing a monoclonal anti-HSP90 Alpha antibody and an HSP90 Alpha-HRP conjugate. The assay sample and buffer are incubated together with HSP90 Alpha-HRP conjugate in pre-coated plate for one hour. After the incubation period, the wells are decanted and washed five times. The wells are then incubated with a substrate for HRP enzyme. The product of the enzyme-substrate reaction forms a blue colored complex. Finally, a stop solution is added to stop the reaction, which will then turn the solution yellow. The intensity of color is measured spectrophotometrically at 450nm in a microplate reader. The intensity of the color is inversely proportional to the HSP90 Alpha concentration since HSP90 Alpha from samples and HSP90 Alpha-HRP conjugate compete for the anti-HSP90 Alpha antibody binding site. Since the number of sites is limited, as more sites are occupied by HSP90 Alpha from the sample, fewer sites are left to bind HSP90 Alpha-HRP conjugate. A standard curve is plotted relating the intensity of the color (O.D.) to the concentration of standards. The HSP90 Alpha concentration in each sample is interpolated from this standard curve.
