

Mouse S-Adenosyl-L-homocysteine ELISA Kit | SAH elisa kit

Mouse S-Adenosyl-L-homocysteine ELISA Kit

CATALOG #
AAA247698

REACTIVITY
Mouse

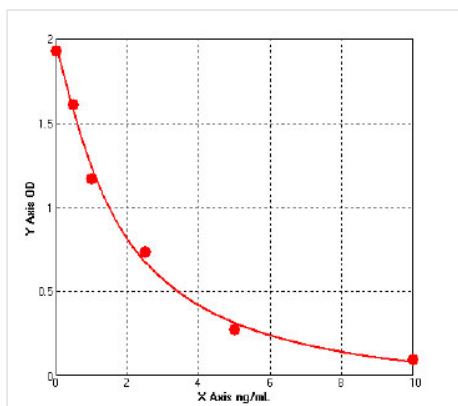

PRODUCT SYNONYMS

S-Adenosyl-L-homocysteine; Mouse S-Adenosyl-L-homocysteine ELISA Kit; SAH elisa kit

PRODUCT SPECIFICATIONS

Reactivity	Mouse
Specificity	This assay has high sensitivity and excellent specificity for detection of SALM. No significant cross-reactivity or interference between SALM and analogues was observed. NOTE: Limited by current skills and knowledge, it is impossible for us to complete the cross-reactivity detection between SALM and all the analogues, therefore, cross reaction may still exist in some cases.
Samples	Serum, plasma, cell culture supernatants, body fluid and tissue homogenate
Assay Type	Quantitative Competitive
Sensitivity	0.1 ng/mL
Preparation and Storage	Store all reagents at 2-8 degree C.

ADDITIONAL INFORMATION

Related Product Information for SAH elisa kit	Intended Uses: This SALM ELISA kit is a 1.5 hour solid-phase ELISA designed for the quantitative determination of Mouse SALM. This ELISA kit for research use only, not for therapeutic or test applications! Principle of the Assay: SALM ELISA kit applies the competitive enzyme immunoassay technique utilizing an anti-SALM antibody and an SALM-HRP conjugate. The assay sample and buffer are incubated together with SALM-HRP conjugate in pre-coated plate for one hour. After the incubation period, the wells are decanted and washed five times. The wells are then incubated with a substrate for HRP enzyme. The product of the enzyme-substrate reaction forms a blue colored complex. Finally, a stop solution is added to stop the reaction, which will then turn the solution yellow. The intensity of color is measured spectrophotometrically at 450nm in a microplate reader. The intensity of the color is inversely proportional to the SALM concentration since SALM from samples and SALM-HRP conjugate compete for the anti-SALM antibody binding site. Since the number of sites is limited, as more sites are occupied by SALM from the sample, fewer sites are left to bind SALM-HRP conjugate. A standard curve is plotted relating the intensity of the color (O.D.) to the concentration of standards. The SALM concentration in each sample is interpolated from this standard curve.
