Principle of the Assay: This kit was based on Competitive-ELISA detection method. The microtiter plate provided in this kit has been pre-coated with CCK-8. During the reaction, CCK-8 in the sample or standard competes with a fixed amount of CCK-8 on the solid phase supporter for sites on the Biotinylated Detection Antibody specific to CCK-8. Excess conjugate and unbound sample or standard are washed from the plate, and HRP-Streptavidin (SABC) is added to each microplate well and incubated. Then TMB substrate solution is added to each well. The enzyme-substrate reaction is terminated by the addition of a sulphuric acid solution and the color change is measured spectrophotometrically at a wavelength of 450 nm. The concentration of CCK-8 in the samples is then determined by comparing the O D of the samples to the standard curve.
