IMAGES

IHC (Immunohistochemistry)

Immunohistochemical staining of human MAP2K6 in human heart with rabbit polyclonal antibody (1:1000, formalin-fixed paraffin embedded sections).

IHC (Immunohistochemistry)

Immunohistochemical staining of human MAP2K6 in human skeletal muscle with rabbit polyclonal antibody (1:1000, formalin-fixed paraffin embedded sections).

IF (Immunofluorescence)
Immunofluorescence staining of MAP2K6 in HeLa cells. Cells were fixed with 4% PFA, blocked with 10% serum, and incubated with rabbit anti-human MAP2K6 polyclonal antibody (1:1000) at 4 degree C overnight. Then cells were stained with the Alexa Fluor594-conjugated Goat Anti-rabbit IgG secondary antibody (red) and counterstained with DAPI (blue). Positive staining was localized to cytoplasm and nucleus.

ADDITIONAL INFORMATION

Related Product Information for anti-MAP2K6 antibody	Dual specificity mitogen-activated protein kinase kinase 6, also known as MAP kinase kinase 6, MAPKK 6, MAPK/ERK kinase 6, SAPKK3, MAP2K6, and MKK6, is a protein that belongs to the protein kinase superfamily, STE Ser/Thr protein kinase family and MAP kinase kinase subfamily. MAP2K6/MKK6 contains one protein kinase domain. Mitogen-activated protein kinases are members of a conserved cascade of kinases involved in many signal transduction pathways. They stimulate phosphorylation of transcription factors in response to extracellular signals such as growth factors, cytokines, ultraviolet light, and stress-inducing agents. MAP2K6/MKK6 exists in a variety of alternatively spliced isoforms with distinct patterns of tissue expression. Isoform 2 of MAP2K6/MKK6 is only expressed in skeletal muscle. Isoform 1 of MAP2K6/MKK6 is expressed in skeletal muscle, heart, and to a lesser extent in liver or pancreas.
