Principle of the Assay: The kit assay Human HP IgG level in the sample, use Purified antigen to coat microtiter plate wells, make solid-phase antigen, then add HP IgG to wells, Combined antigen which With HRP labeled, become antigen - antibody - enzyme-antigen complex, after washing Completely, Add TMB substrate solution,TMB substrate becomes blue color At HRP enzyme-catalyzed, reaction is terminated by the addition of a sulphuric acid solution and the color change is measured spectrophotometrically at a wavelength of 450 nm. The concentration of Human HP IgG in the samples is then determined by comparing the O.D. of the samples to the standard curve.

For Research Use Only. Not for use in diagnostic or therapeutic procedures. Small volumes of product may become entrapped in the seal of the vial during shipment and storage; if necessary, briefly centrifuge the vial on a tabletop centrifuge to dislodge any liquid in the cap.
