Reactivity	Human
Specificity	This assay has high sensitivity and excellent specificity for detection of ABCC8. No significant cross-reactivity or interference between ABCC8 and analogues was observed. NOTE: Limited by current skills and knowledge, it is impossible for us to complete the cross-reactivity detection between ABCC8 and all the analogues, therefore, cross reaction may still exist in some cases.
Samples	Serum, plasma, cell culture supernatants, body fluid and tissue homogenate
Assay Type	Quantitative Competitive
Sensitivity	0.1 ng/mL

Intended Uses: This ABCC8 ELISA kit is a 1.5 hour solid-phase ELISA designed for the quantitative determination of HumanABCC8. This ELISA kit for research use only, not for therapeutic or test applications!

Principle of the Assay: ABCC8 ELISA kit applies the competitive enzyme immunoassay technique utilizing a polyclonal anti-ABCC8 antibody and an ABCC8-HRP conjugate. The assay sample and buffer are incubated together with ABCC8-HRP conjugate in pre-coated plate for one hour. After the incubation period, the wells are decanted and washed five times. The wells are then incubated with a substrate for HRP enzyme. The product of the enzyme-substrate reaction forms a blue colored complex. Finally, a stop solution is added to stop the reaction, which will then turn the solution yellow. The intensity of color is measured spectrophotometrically at 450nm in a microplate reader. The intensity of the color is inversely proportional to the ABCC8 concentration since ABCC8 from samples and ABCC8-HRP conjugate compete for the anti-ABCC8 antibody binding site. Since the number of sites is limited, as more sites are occupied by ABCC8 from the sample, fewer sites are left to bind ABCC8-HRP conjugate. A standard curve is plotted relating the intensity of the color (O.D.) to the concentration of standards. The ABCC8 concentration in each sample is interpolated from this standard curve.
