Principle of the Assay: This assay employs the competitive inhibition enzyme immunoassay technique. The microtiter plate provided in this kit has been pre-coated with Somatostatin(SST) protein. Standards or samples are added to the appropriate microtiter plate wells then with a biotin-conjugated antibody specific to Somatostatin(SST). Next,Avidin conjugated to Horseradish Peroxidase (HRP) is added to each microplate well and incubated. After TMB substrate solution is added. The enzyme-substrate reaction is terminated by the addition of sulphuric acid solution and the color change is measured spectrophotometrically at a wavelength of 450nm ± 10nm. The concentration of Somatostatin(SST) in the samples is then determined by comparing the OD of the samples to the standard curve.
