Principle of the Assay: This assay employs the competitive inhibition enzyme immunoassay technique. The microtiter plate provided in this kit has been pre-coated with Chicken IgY protein. Standards or samples are added to the appropriate microtiter plate wells then with a biotinconjugated antibody specific to Chicken IgY. Next, Avidin conjugated to Horseradish Peroxidase (HRP) is added to each microplate well and incubated. After TMB substrate solution is added. The enzyme-substrate reaction is terminated by the addition of sulphuric acid solution and the color change is measured spectrophotometrically at a wavelength of 450nm $\pm$ 10nm. The concentration of Chicken IgY in the samples is then determined by comparing the OD of the samples to the standard curve.
