Sequence Length	126
Applicable Applications for anti-HIST1H2BJ antibody	ELISA, WB (Western Blot)
Calculated MW	13904
Function	Core component of nucleosome. Nucleosomes wrap and compact DNA into chromatin, limiting DNA accessibility to the cellular machineries which require DNA as a template. Histones thereby play a central role in transcription regulation, DNA repair, DNA replication and chromosomal stability. DNA accessibility is regulated via a complex set of post-translational modifications of histones, also called histone code, and nucleosome remodeling.
Preparation and Storage	Maintain refrigerated at 2-8°C for up to 2 weeks.. For long term storage store at -20°C in small aliquots to prevent freeze-thaw cycles.

WB (Western Blot)

HIST1H2BJ/HIST1H2BK/HIST3H2BB Antibody (C-term) western blot analysis in NCI-H292 cell line lysates (35ug/lane). This demonstrates the HIST1H2BJ/HIST1H2BK/HIST3H2BB antibody detected the HIST1H2BJ/HIST1H2BK/HIST3H2BB protein (arrow).

ADDITIONAL INFORMATION

Related Product Information for anti-HIST1H2BJ antibody	Histones are basic nuclear proteins that are responsible for the nucleosome structure of the chromosomal fiber in eukaryotes. Two molecules of each of the four core histones (H2A, H2B, H3, and H4) form an octamer, around which approximately 146 bp of DNA is wrapped in repeating units, called nucleosomes. The linker histone, H1, interacts with linker DNA between nucleosomes and functions in the compaction of chromatin into higher order structures. This gene is intronless and encodes a member of the histone H2B family. Transcripts from this gene lack polyA tails but instead contain a palindromic termination element. This gene is found in the histone microcluster on chromosome 6p21.33. [provided by RefSeq].
