Principle of the Assay: Human Sphingosine Kinase 1 (SPK1) ELISA Kit employs a two-site sandwich ELISA to quantitate SPK1 in samples. An antibody specific for SPK1 has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any SPK1 present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugated Human SPK1 detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of SPK1 bound in the initial step. The color development is stopped and the intensity of the color is measured.

Background/Introduction: Sphingosine kinase 1 (SPK1) catalyzes the phosphorylation of sphingosine to form sphingosine-1-phosphate (S1P), a lipid mediator with both intra- and extracellular functions. Intracellularly, S1P regulates proliferation and survival, and extracellularly, it is a ligand for cell surface G protein-coupled receptors. SPK1, and its product S1P, play a key role in TNF-alpha signaling and the NF-kappa-B activation pathway important in inflammatory, antiapoptotic, and immune processes.
