Principle of the Assay: Human Amiloride-sensitive sodium channel subunit gamma (SCNN1G) ELISA Kit employs a two-site sandwich ELISA to quantitate SCNN1G in samples. An antibody specific for Human SCNN1G has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any SCNN1G present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugated SCNN1G detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of SCNN1G bound in the initial step. The color development is stopped and the intensity of the color is measured.
