Principle of the Assay: Human Double-stranded RNA-specific Adenosine Deaminase (ADAR) ELISA Kit employs a two-site sandwich ELISA to quantitate ADAR in samples. An antibody specific for ADAR has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any ADAR present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugated Human ADAR detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of ADAR bound in the initial step. The color development is stopped and the intensity of the color is measured.

Background/Introduction: Double-stranded RNA-specific adenosine deaminase is an enzyme responsible for RNA editing by site-specific deamination of adenosines. This enzyme destabilizes double stranded RNA through conversion of adenosine to inosine. Mutations in this gene have been associated with dyschromatosis symmetrica hereditaria. Alternate transcriptional splice variants, encoding different isoforms, have been characterized. ADAR requires the small molecule inositol hexakisphosphate (IP6) for proper function.
