Principle of the Assay: Human Myosin Light Chain 6B (MYL6B) ELISA Kit employs a two-site sandwich ELISA to quantitate MYL6B in samples. An antibody specific for MYL6B has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any MYL6B present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugated Human MYL6B detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of MYL6B bound in the initial step. The color development is stopped and the intensity of the color is measured.

Background/Introduction: The production of myosin light chain 6B (MYL6B) recombinant protein is a protein obtained by applying recombinant DNA or recombinant RNA technology. At present, the production of recombinant proteins in vitro mainly includes four major systems: prokaryotic protein expression, mammalian cell protein expression, yeast protein expression and insect cell protein expression. The proteins produced differ in activity and application methods. Choose the appropriate protein expression system according to its own downstream applications to improve the expression success rate.
