Principle of the Assay: Human Matrix Metalloproteinase 12 (MMP-12) ELISA Kit employs a two-site sandwich ELISA to quantitate MMP-12 in samples. An antibody specific for MMP-12 has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any MMP-12 present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugated Human MMP-12 detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of MMP-12 bound in the initial step. The color development is stopped and the intensity of the color is measured.

Background/Introduction: MMP-12 encodes a member of the peptidase M10 family of matrix metalloproteinases (MMPs). Proteins in this family are involved in the breakdown of extracellular matrix in normal physiological processes, such as embryonic development, reproduction, and tissue remodeling, as well as in disease processes, such as arthritis and metastasis. The encoded preproprotein is proteolytically processed to generate the mature protease. This protease degrades soluble and insoluble elastin. MMP-12 may play a role in aneurysm formation and mutations in this gene are associated with lung function and chronic obstructive pulmonary disease (COPD). MMP-12 is part of a cluster of MMP genes on chromosome 11.
