Principle of the Assay: Mouse Transgelin (TAGLN) ELISA Kit employs a two-site sandwich ELISA to quantitate TAGLN in samples. An antibody specific for TAGLN has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any TAGLN present is bound by the immobilized antibody. After removing any unbound substances, HRP-Conjugated TAGLN detection antibody is added to the wells. Following a wash to remove any unbound HRP reagent, a Chromogen solution is added to the wells and color develops in proportion to the amount of TAGLN bound in the initial step. The color development is stopped and the intensity of the color is measured.
