ADDITIONAL INFORMATION

Related Product Information for GM-CSF elisa kit	Principle of the Assay: Granulocyte-macrophage colony-stimulating factor (GM-CSF) is a cytokine that stimulates the growth and differentiation of hematopoietic precursor cells from various lineages, including granulocytes, macrophages, eosinophils and erythrocytes. Human GM-CSF ELISA Kit employs a double antibody sandwich method to quantitate Human GM-CSF in samples. An antibody specific for Human GM-CSF has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any Human GM-CSF present is bound by the immobilized antibody. After removing any unbound substances, a biotin-conjugated antibody specific for Human GM-CSF is added to the wells. After washing, proprietary Streptavidin-HRP conjugates is added to the wells. Following a wash to remove any unbound streptavidin-enzyme reagent, adding HRP Substrate (TMB), TMB turns blue under the catalysis of HRP, and turns yellow after adding stop solution. Measure the OD value with a microplate reader at 450nm wavelength. The GM-CSF concentration is proportional to the OD450 nm value.
