ADDITIONAL INFORMATION

Related Product Information for Manea elisa kit	Principle of the Assay: The microtiter plate provided in this kit has been pre-coated with an antibody specific to Endo-alpha mannosidase. Standards or samples are then added to the appropriate microtiter plate wells with a biotin-conjugated polyclonal antibody preparation specific for Endo-alpha mannosidase and Avidin conjugated to Horseradish Peroxidase (HRP) is added to each microplate well and incubated. Then a TMB substrate solution is added to each well. Only those wells that contain Endo-alpha mannosidase, biotin-conjugated antibody and enzyme-conjugated Avidin will exhibit a change in color. The enzyme-substrate reaction is terminated by the addition of a sulphuric acid solution and the color change is measured spectrophotometrically at a wavelength of 450 nm +/- 2 nm. The concentration of Endo-alpha mannosidase in the samples is then determined by comparing the O.D. of the samples to the standard curve.
