ADDITIONAL INFORMATION

Related Product Information for Glycoprotein of Rabies Virus recombinant protein	Description: 6xHis tagged recombinant protein expressed in E. coli. Introduction: Rabies lyssavirus (genus of the Rhabdoviridae family), formerly Rabies virus, is a neurotropic virus that causes rabies in humans and animals. Rabies virus is a rod- or bullet-shaped, single-stranded, negative-sense, unsegmented, enveloped RNA virus. The rabies genome encodes five proteins: nucleoprotein (N), phosphoprotein (P), matrix protein (M), glycoprotein (G) and polymerase (L). It has two major structural components: a helical ribonucleoprotein core (RNP) and a surrounding lipoprotein envelope embedded with knob-like Glycoprotein (G) spikes. Viral Protein: Glycoprotein (amino acid 20-458) of Rabies virus (GenBank Accession No. BAI50726)
