ADDITIONAL INFORMATION

Related Product Information for F9 elisa kit	Intended Uses: The kit is a sandwich enzyme immunoassay for in vitro quantitative measurement of F9 in human plasma Principle of the Assay: The microtiter plate provided in this kit has been pre-coated with an antibody specific to F9. Standards or samples are then added to the appropriate microtiter plate wells with a biotin-conjugated antibody preparation specific to F9. Next, Avidin conjugated to Horseradish Peroxidase (HRP) is added to each microplate well and incubated. After TMB substrate solution is added, only those wells that contain F9, biotin-conjugated antibody and enzyme-conjugated Avidin will exhibit a change in color. The enzyme-substrate reaction is terminated by the addition of sulphuric acid solution and the color change is measured spectrophotometrically at a wavelength of 450nm +/- 10nm. The concentration of F9 in the samples is then determined by comparing the O.D. of the samples to the standard curve.
