Application Data

Blots of TDP43 on crude extract of mouse brain nuclear fraction (left lane) and cytoplasmic fraction (right lane). There is a strong clear band in the nuclear preparation running at 43kDa, and a much more minor band in the cytoplasmic fraction.

Application Data

Image: TDP43 staining of formalin fixed adult rat brain, specifically the hippocampus. Hippocampal neuron nuclei are stained strongly. Chicken antibody to GFAP (green) shows the processes of astrocytic glial cells. Nuclei of all cells are revealed with DAPI DNA stain (blue). The TARDP antibody stains neuronal nuclei strongly and the nuclei of some non-neuronal cells much more weakly. Neuronal nuclei therefore look crimson, since they are both red due to the content of TDP43 and blue due to their content of DNA, stained blue with DAPI. Protocol on data-sheet.
