ADDITIONAL INFORMATION

Related Product Information for TGF-beta1 elisa kit	The three mammalian isoforms of TGF-beta, TGF-beta1, beta2, and beta3, signal through the same receptor and elicit similar biological responses. They are multifunctional cytokines that regulate cell proliferation, growth, differentiation and motility, as well as synthesis and deposition of the extracellular matrix. They are involved in various physiological processes, including embryogenesis, tissue remodeling and wound healing. They are secreted predominantly as latent complexes, which are stored at the cell surface and in the extracellular matrix. The release of the biologically active TGF-beta isoform from a latent complex involves proteolytic processing of the complex and /or induction of conformational changes by proteins such as thrombospondin-1. TGF-beta2 has been shown to exert suppressive effects on IL-2-dependent T-cell growth, and may also have an autocrine function in enhancing tumor growth by suppressing immuno-surveillance of tumor development. Murine TGF- beta1 Pre-Coated ELISA (Enzyme-Linked Immunosorbent Assay) kit is a solid phase immunoassay specially designed to measure Murine TGF- beta1 with a 96-well strip plate that is pre-coated with rat monoclonal antibody specific for TGF- beta1. It contains CHO-expressed recombinant Murine TGF- beta1. The detection antibody is a biotinylated goat polyclonal antibody specific for TGF- beta1. The kit is analytically validated with ready to use reagents.
