ADDITIONAL INFORMATION

Related Product Information for GCG elisa kit	Principle of the Assay: This assay employs the quantitative sandwich enzyme immunoassay technique. Antibody specific for GC has been pre-coated onto a microplate. Standards and samples are pipetted into the wells and any GC present is bound by the immobilized antibody. After removing any unbound substances, a biotin-conjugated antibody specific for GC is added to the wells. After washing, avidin conjugated Horseradish Peroxidase (HRP) is added to the wells. Following a wash to remove any unbound avidin-enzyme reagent, a substrate solution is added to the wells and color develops in proportion to the amount of GC bound in the initial step. The color development is stopped and the intensity of the color is measured.
