

Mouse arginine vasopressin, AVP ELISA Kit | AVP elisa kit

Mouse arginine vasopressin, AVP ELISA Kit

CATALOG #
AAA82236

REACTIVITY
Mouse

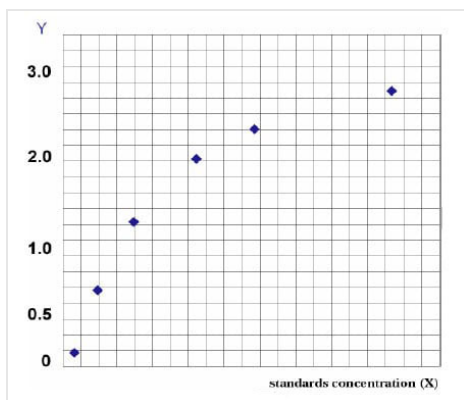

PRODUCT SYNONYMS

arginine vasopressin; AVP; Mouse arginine vasopressin; AVP ELISA Kit; AVP ELISA Kit (Mouse); AVP elisa kit

PRODUCT SPECIFICATIONS

Reactivity	Mouse
Assay Type	Sandwich
Preparation and Storage	Store all reagents at 2-8 degree C

Standard Curve (Sample)

ADDITIONAL INFORMATION

Related Product Information for AVP elisa kit

Intended Uses: This AVP ELISA kit is intended Laboratory for research use only. The Stop Solution changes the color from blue to yellow and the intensity of the color is measured at 450 nm using a spectrophotometer. In order to measure the concentration of AVP in the sample, this AVP ELISA Kit includes a set of calibration standards. The calibration standards are assayed at the same time as the samples and allow the operator to produce a standard curve of Optical Density versus AVP concentration. The concentration of AVP in the samples is then determined by comparing the O.D. of the samples to the standard curve.

Principle of the Assay: This AVP enzyme linked immunosorbent assay applies a technique called a quantitative sandwich immunoassay. The microtiter plate provided in this kit has been pre-coated with a monoclonal antibody specific for AVP. Standards or samples are then added to the microtiter plate wells and AVP if present, will bind to the antibody pre-coated wells. In order to quantitatively determine the amount of AVP present in the sample, a standardized preparation of horseradish peroxidase (HRP)-conjugated polyclonal antibody, specific for AVP are added to each well to "sandwich" the AVP immobilized on the plate. The microtiter plate undergoes incubation, and then the wells are thoroughly washed to remove all unbound components. Next, A and B substrate solution is added to each well. The enzyme (HRP) and substrate are allowed to react over a short incubation period. Only those wells that contain AVP and enzyme-conjugated antibody will exhibit a change in colour. The enzyme-substrate reaction is terminated by the addition of a sulphuric acid solution and the colour change is measured spectrophotometrically at a wavelength of 450 nm.
