

## Rabbit alpha1-microglobulin ELISA Kit | alpha1-MG elisa kit

Rabbit alpha1-microglobulin ELISA Kit

CATALOG #  
**AAA86122**

REACTIVITY  
**Rabbit**

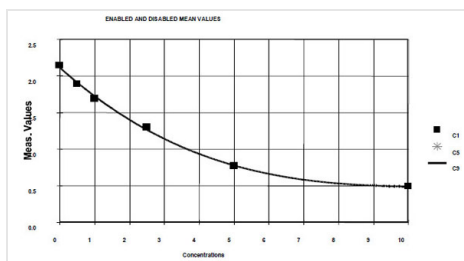

### PRODUCT SYNONYMS

alpha1-microglobulin; Rabbit alpha1-microglobulin ELISA Kit; a1-microglobulin; alpha1-microglobulin (Rabbit); alpha1-MG elisa kit

### PRODUCT SPECIFICATIONS

|                         |                                                                           |
|-------------------------|---------------------------------------------------------------------------|
| Reactivity              | Rabbit                                                                    |
| Samples                 | Cell culture fluid & body fluid & tissue homogenate Serum or blood plasma |
| Preparation and Storage | Store all reagents at 2-8 degree C                                        |

### ADDITIONAL INFORMATION

**Related Product Information for alpha1-MG elisa kit**

**For Samples:** Cell culture fluid & body fluid & tissue homogenate Serum or blood plasma

**Intended Uses:** This A1-MG ELISA kit is intended for laboratory research use only. The stop solution changes the color from blue to yellow and the intensity of the color is measured at 450 nm using a spectrophotometer. In order to measure the concentration of A1-MG in the sample, this A1-MG ELISA Kit includes a set of calibration standards. The calibration standards are assayed at the same time as the samples and allow the operator to produce a standard curve of Optical Density versus A1-MG concentration. The concentration of in the samples is then determined by comparing the O.D. of the samples to the standard curve.

**Principle of the Assay:** The coated well immunoenzymatic assay for the quantitative measurement of A1-MG utilizes a multiclonal anti-A1-MG antibody and an A1-MG-HRP conjugate. The assay sample and buffer are incubated together with A1-MG-HRP conjugate in pre-coated plate for one hour. After the incubation period, the wells are decanted and washed five times. The wells are then incubated with a substrate for HRP enzyme. The product of the enzyme-substrate reaction forms a blue colored complex. Finally, a stop solution is added to stop the reaction, which will then turn the solution yellow. The intensity of color is measured spectrophotometrically at 450nm in a microplate reader. The intensity of the color is inversely proportional to the A1-MG concentration since A1-MG from samples and A1-MG-HRP conjugate compete for the anti-A1-MG antibody binding site. Since the number of sites is limited, as more sites are occupied by A1-MG from the sample, fewer sites are left to bind A1-MG-HRP conjugate. Standards of known A1-MG concentrations are run concurrently with the samples being assayed and a standard curve is plotted relating the intensity of the color (Optical Density) to the concentration of A1-MG. The A1-MG concentration in each sample is interpolated from this standard curve.
