

Mouse apelin 13, AP13 ELISA Kit | AP13 elisa kit

Mouse apelin 13, AP13 ELISA Kit

CATALOG #
AAA87854

REACTIVITY
Mouse

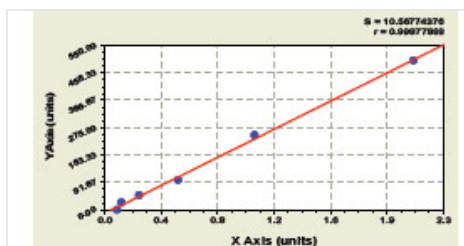

PRODUCT SYNONYMS

apelin 13; AP13; Mouse apelin 13; AP13 ELISA Kit; AP13 ELISA Kit (Mouse); AP13 elisa kit

PRODUCT SPECIFICATIONS

Reactivity	Mouse
Assay Type	Sandwich
Preparation and Storage	Store all reagents at 2-8 degree C

ADDITIONAL INFORMATION

Related Product Information for AP13 elisa kit

Intended Uses: This AP13 ELISA kit is intended Laboratory for research use only. The Stop Solution changes the color from blue to yellow and the intensity of the color is measured at 450 nm using a spectrophotometer. In order to measure the concentration of AP13 in the sample, this AP13 ELISA Kit includes a set of calibration standards. The calibration standards are assayed at the same time as the samples and allow the operator to produce a standard curve of Optical Density versus AP13 concentration. The concentration of AP13 in the samples is then determined by comparing the O.D. of the samples to the standard curve.

Principle of the Assay: This AP13 enzyme linked immunosorbent assay applies a technique called a quantitative sandwich immunoassay. The microtiter plate provided in this kit has been pre-coated with a monoclonal antibody specific for AP13. Standards or samples are then added to the microtiter plate wells and AP13 if present, will bind to the antibody pre-coated wells. In order to quantitatively determine the amount of AP13 present in the sample, a standardized preparation of horseradish peroxidase (HRP)-conjugated polyclonal antibody, specific for AP13 are added to each well to "sandwich" the AP13 immobilized on the plate. The microtiter plate undergoes incubation, and then the wells are thoroughly washed to remove all unbound components. Next, A and B substrate solution is added to each well. The enzyme (HRP) and substrate are allowed to react over a short incubation period. Only those wells that contain AP13 and enzyme-conjugated antibody will exhibit a change in colour. The enzyme-substrate reaction is terminated by the addition of a sulphuric acid solution and the colour change is measured spectrophotometrically at a wavelength of 450 nm.
