ADDITIONAL INFORMATION

Related Product Information for ANGPTL4 elisa kit	Principle of the assay: ANGPTL4 ELISA kit applies the competitive enzyme immunoassay technique utilizing a monoclonal anti-ANGPTL4 antibody and an ANGPTL4-HRP conjugate. The assay sample and buffer are incubated together with ANGPTL4-HRP conjugate in pre-coated plate for one hour. After the incubation period, the wells are decanted and washed five times. The wells are then incubated with a substrate for HRP enzyme. The product of the enzyme-substrate reaction forms a blue colored complex. Finally, a stop solution is added to stop the reaction, which will then turn the solution yellow. The intensity of color is measured spectrophotometrically at 450nm in a microplate reader. The intensity of the color is inversely proportional to the ANGPTL4 concentration since ANGPTL4 from samples and ANGPTL4-HRP conjugate compete for the anti-ANGPTL4 antibody binding site. Since the number of sites is limited, as more sites are occupied by ANGPTL4 from the sample, fewer sites are left to bind ANGPTL4-HRP conjugate. A standard curve is plotted relating the intensity of the color (O.D.) to the concentration of standards. The ANGPTL4 concentration in each sample is interpolated from this standard curve.
