INTENDED USE This CDSN ELISA kit is a 1.5 hour solid-phase ELISA designed for the quantitative determination of Goat CDSN. This ELISA kit for research use only!

PRINCIPLE OF THE ASSAY CDSN ELISA kit applies the competitive enzyme immunoassay technique utilizing a monoclonal anti-CDSN antibody and an CDSN-HRP conjugate. The assay sample and buffer are incubated together with CDSN-HRP conjugate in pre-coated plate for one hour. After the incubation period, the wells are decanted and washed five time. The wells are then incubated with a substrate for HRP enzyme. The product of the enzyme-substrate reaction forms a blue colored complex. Finally, a stop solution is added to stop the reaction, which will then turn the solution yellow. The intensity of color is measured spectrophotometrically at 450nm in a microplate reader. The intensity of the color is inversely proportional to the CDSN concentration since CDSN from samples and CDSN-HRP conjugate compete for the anti-CDSN antibody binding site. Since the number of sites is limited, as more sites are occupied by CDSN from the sample, fewer sites are left to bind CDSN-HRP conjugate. A standard curve is plotted relating the intensity of the color (O.D.) to the concentration of standards. The CDSN concentration in each sample is interpolated from this standard curve.
