Related Product Information for IGF1 elisa kit	For samples: Serum, plasma, cell culture supernatants, body fluid and tissue homogenate INTENDED USE This IGF1 ELISA kit is a 1.5 hour solid-phase ELISA designed for the quantitative determination of Sheep IGF1. This ELISA kit for research use only! PRINCIPLE OF THE ASSAY IGF1 ELISA kit applies the competitive enzyme immunoassay technique utilizing amonoclonal anti-IGF1 antibody and an IGF1-HRP conjugate. The assay sample and buffer are incubated together with IGF1-HRP conjugate in pre-coated plate for one hour. After the incubation period, the wells are decanted and washed five times. The wells are then incubated with a substrate for HRP enzyme. The product of the enzyme-substrate reaction forms a blue colored complex. Finally, a stop solution is added to stop the reaction, which will then turn the solution yellow. The intensity of color is measured spectrophotometrically at 450nm in a microplate reader. The intensity of the color is inversely proportional to the IGF1 concentration since IGF1 from samples and IGF1-HRP conjugate compete for the anti-IGF1 antibody binding site. Since the number of sites is limited, as more sites are occupied by IGF1 from the sample, fewer sites are left to bind IGF1-HRP conjugate. A standard curve is plotted relating the intensity of the color (O.D.) to the concentration of standards. The IGF1 concentration in each sample is interpolated from this standard curve.
