INTENDED USE This AR ELISA kit is a 1.5 hour solid-phase ELISA designed for the quantitative determination of Mouse AR. This ELISA kit for research use only!

PRINCIPLE OF THE ASSAY AR ELISA kit applies the competitive enzyme immunoassay technique utilizing a monoclonal anti-AR antibody and an AR-HRP conjugate. The assay sample and buffer are incubated together with AR-HRP conjugate in pre-coated plate for one hour. After the incubation period, the wells are decanted and washed five times. The wells are then incubated with a substrate for HRP enzyme. The product of the enzyme-substrate reaction forms a blue colored complex. Finally, a stop solution is added to stop the reaction, which will then turn the solution yellow. The intensity of color is measured spectrophotometrically at 450nm in a microplate reader. The intensity of the color is inversely proportional to the AR concentration since AR from samples and AR-HRP conjugate compete for the anti-AR antibody binding site. Since the number of sites is limited, as more sites are occupied by AR from the sample, fewer sites are left to bind AR-HRP conjugate. A standard curve is plotted relating the intensity of the color (O.D.) to the concentration of standards. The AR concentration in each sample is interpolated from this standard curve.
