INTENDED USE This ANG ELISA kit is a 1.5 hour solid-phase ELISA designed for the quantitative determination of Sheep ANG. This ELISA kit for research use only!

PRINCIPLE OF THE ASSAY ANG ELISA kit applies the competitive enzyme immunoassay technique utilizing a monoclonal anti-ANG antibody and an ANG-HRP conjugate. The assay sample and buffer are incubated together with ANG-HRP conjugate in pre-coated plate for one hour. After the incubation period, the wells are decanted and washed five times. The wells are then incubated with a substrate for HRP enzyme. The product of the enzyme-substrate reaction forms a blue colored complex. Finally, a stop solution is added to stop the reaction, which will then turn the solution yellow. The intensity of color is measured spectrophotometrically at 450nm in a microplate reader. The intensity of the color is inversely proportional to the ANG concentration since ANG from samples and ANG-HRP conjugate compete for the anti-ANG antibody binding site. Since the number of sites is limited, as more sites are occupied by ANG from the sample, fewer sites are left to bind ANG-HRP conjugate. A standard curve is plotted relating the intensity of the color (O.D.) to the concentration of standards. The ANG concentration in each sample is interpolated from this standard curve.
