Principle of the assay: ELN Ab ELISA kit applies the competitive enzyme immunoassay technique utilizing FLN antigen and an ELN Ab-HRP conjugate. The assay sample and buffer are incubated together with ELN Ab-HRP conjugate in pre-coated plate for one hour. After the incubation period, the wells are decanted and washed five times. The wells are then incubated with a substrate for HRP enzyme. The product of the enzyme-substrate reaction forms a blue colored complex. Finally, a stop solution is added to stop the reaction, which will then turn the solution yellow. The intensity of color is measured spectrophotometrically at 450nm in a microplate reader. The intensity of the color is inversely proportional to the ELN Ab concentration since ELN Ab from samples and ELN Ab-HRP conjugate compete for the FLN antigen binding site. Since the number of sites is limited, as more sites are occupied by ELN Ab from the sample, fewer sites are left to bind ELN Ab-HRP conjugate. A standard curve is plotted relating the intensity of the color (O.D.) to the concentration of standards. The ELN Ab concentration in each sample is interpolated from this standard curve.
